

Le SHEER, comité scientifique de la CE sur les effets des basses fréquences électromagnétiques, a publié un rapport https://ec.europa.eu/health/sites/default/files/energy/scheer/docs/scheer_s_002.pdf

page 14 :

“On the horizon, a new generation of even shorter high frequency 5G wavelengths is being proposed to power the Internet of Things (IoT). The IoT promises us convenient and easy lifestyles with a massive 5G interconnected telecommunications network. However, the expansion of broadband with shorter wavelength radiofrequency radiation highlights the concern that health and safety issues remain unknown. Controversy continues with regard to harm from current 2G, 3G and 4G wireless technologies. 5G technologies are far less studied for human or environmental effects” (Russell, 2018).

This concern is more related to the change to 5G rather than a completely new concern. The effects of electromagnetic radiation have been generally well studied, however low frequency electromagnetic radiation is less well studied, hence the justification for introducing this an emerging issue.

5G networks will soon be rolled out for mobile phone and smart device users. How exposure to electromagnetic fields could affect humans remains a controversial area, and studies have not yielded clear evidence of the impact on mammals, birds or insects. The lack of clear evidence to inform the development of exposure guidelines to 5G technology leaves open the possibility of unintended biological consequences.
